

Best Practices in Technology Transfer

Jennifer L Flagg

Center on Knowledge Translation for Technology Transfer

University at Buffalo

ACKNOWLEDGEMENT

The contents of this presentation were developed under a grant from the U.S. Department of Education
National Institute on Disability and Rehabilitation Research
grant #H133A130014.

The opinions contained in this presentation are those of the grantee, and do not necessarily represent the policy of the U.S. Department of Education, and you should not assume endorsement by the Federal Government.

Learning Objectives

- Identify 9 stages of activity involved in NPD and TT
- Describe 7 universal design tools
- Use online NtK Model to access best practices and tools

History

- Center's core team funded since 1993
 - 1993-98: Supply push (technology driven)
 - 1998-2003: Demand pull (market driven)
 - 2003-08: Corporate collaboration
 - 2008-13: Generate models, methods, metrics
 - 2013-18: **New!** Tools and technical assistance

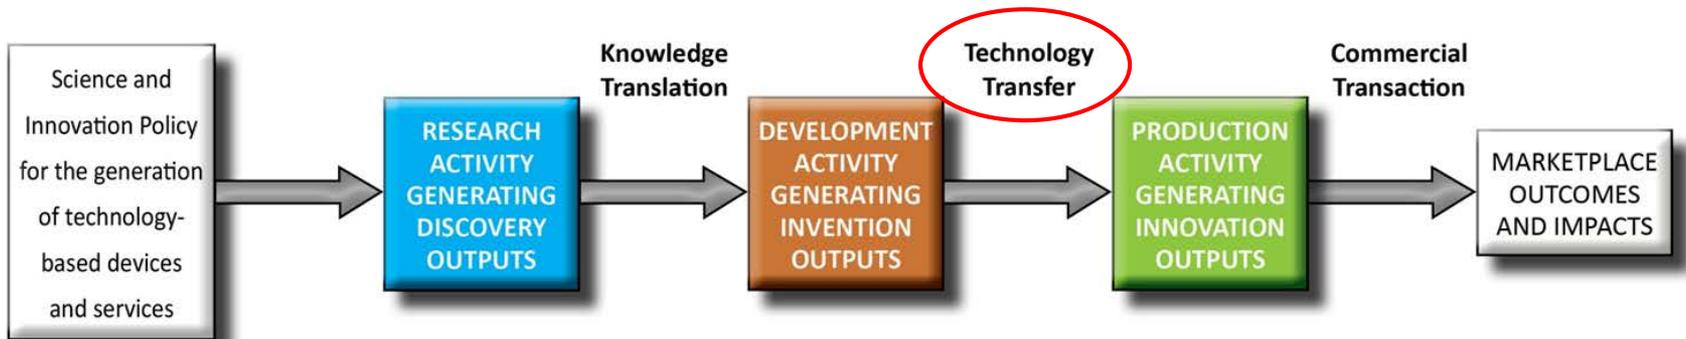

What is Technology Transfer (TT)?

- The *process* of changing ownership and control over an invention from the creator to a party intending to generate a commercial product or service.

When does TT happen?

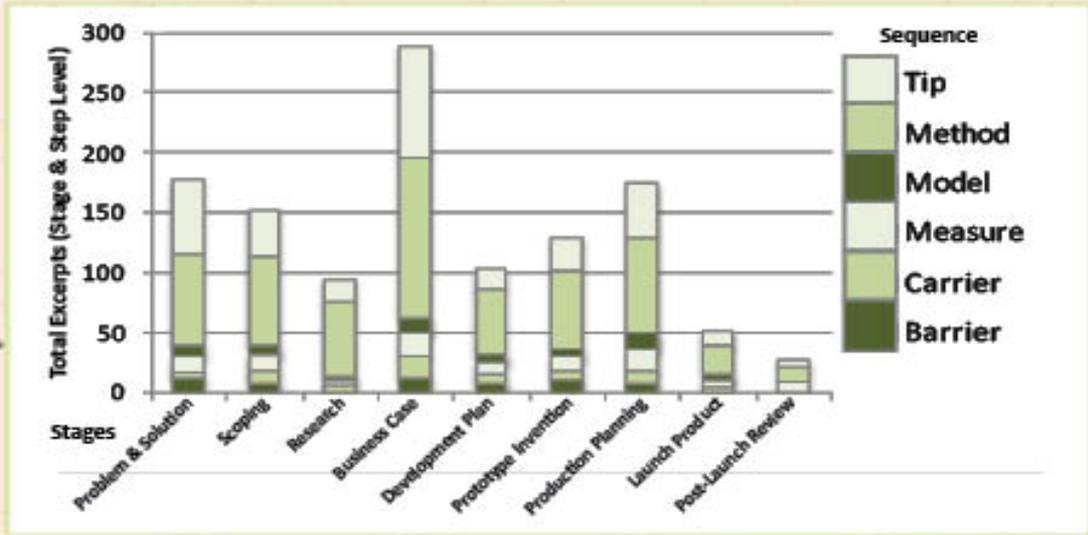

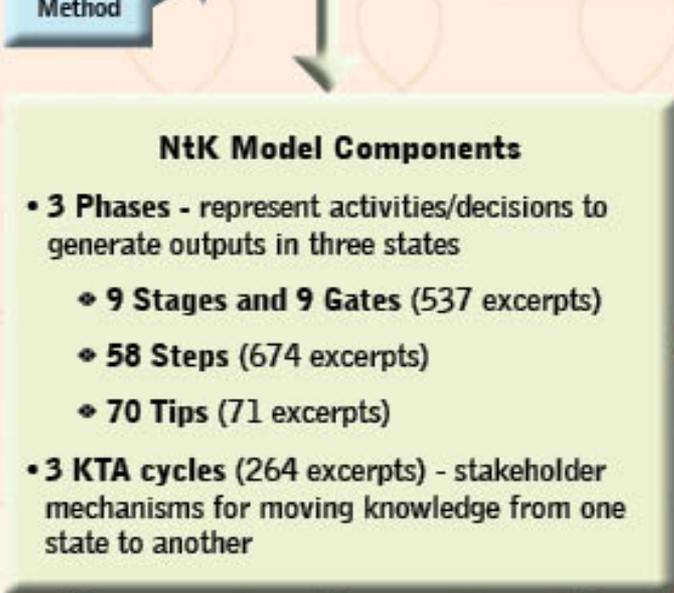

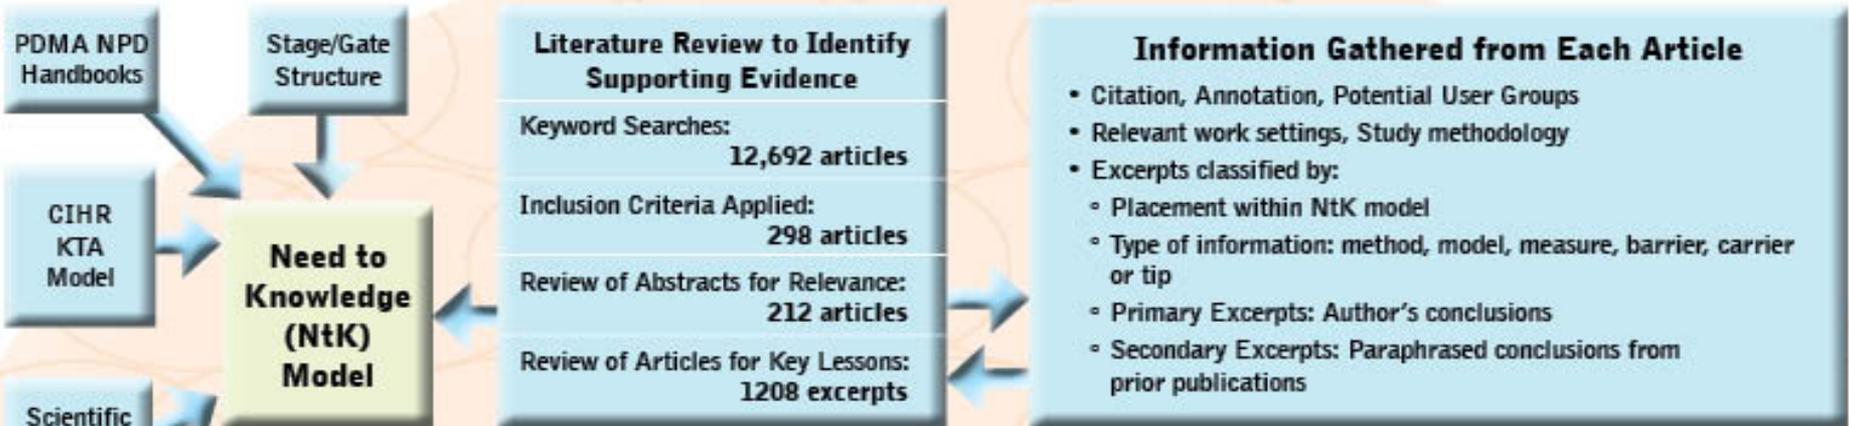

- The *actual transfer of intellectual property* is typically an *intermediate step* between development activity that generates invention outputs and production activity where commercial innovations are formed. ***However, market and business viability should be explored prior to initiating projects intended to produce innovations.***

Three Methods & States

The Need to Knowledge Model

- Stage gate model for generating and commercializing technology based innovations.
- Represents all stages and steps from initial conception through launch, maturity and decline of a product.
 - 3 phases (Research, Development, Production)
 - 9 stages/gates
 - 58 steps
 - 3 transitions between stakeholders
 - Knowledge Translation (KT)
 - Technology Transfer (TT)
 - Commercial Transaction (CT)

Screen Shot of NtK

Discovery Phase

Stage 1: Define Problem and Solution

[Pill crusher example](#)

- 1.1 Opportunity for KT: Assess needs for device or service with input from relevant stakeholders from the six knowledge user (KU) groups.
- 1.2 Identify a problem (need). Identify audience for solution. Identify context for both.
- 1.3 Propose plausible solution (goal) to problem in the form of a device or service.
- 1.4 Determine scope of project (role); output as conceptual discovery, prototype invention or device/service innovation?
- 1.5 Consider path to market.
- Limit disclosure of information regarding solution and document all original thinking related to solution).
- Scope of project determines segments of KT4TT model involved with research generating discovery, development generating invention and production generating innovation level outputs.
- Consider resources, timelines, and partners when defining path to market.
- Opportunity for [Universal Design \(UD\)](#). Be mindful that the problem might be shared by others.

Gate 1: Idea Screen. PI decides to either terminate or move forward with project to develop solution to problem.

Stage 2: Scoping (Initial screen to validate innovativeness and value to target markets)

[Caller connect example](#)

- 2.1 Define innovation opportunity.
- 2.2 Opportunity for KT: Expanding on previously identified needs, perform preliminary valuability assessments (business, market and technical) on device/ service with input from stakeholders in the six KU groups.
- 2.3 Identify potential barriers.
- Delineate [positioning strategy](#) of future device/service.
- Preliminary market assessment- Create potential [value proposition](#) including target price and performance parameters. Is concept novel and useful? Will prototype have value to intermediary [stakeholders](#)? Will device/service have value by the time it reaches the marketplace? Are there others who could also use this solution, thereby broadening the market?
- Preliminary business assessment - For profit, cost recovery or freely distributed? Development and production phases internal or via stakeholders? Conduct [SWOT analysis](#) to identify barriers. Develop intellectual property strategy (e.g., NDA agreements), examine regulatory and reimbursement issues. Consider opportunity to achieve economies of scale for traditionally niche products, by expanding functional design to accommodate more user groups.
- Preliminary technical assessment – Is it technically feasible and do capabilities exist internally or externally to develop and/or produce?

Gate 2: Feasibility Screen. PI must decide if envisioned project output and eventual device/service outcomes are still considered innovative in the light of results from assessments. PI decides if generation of new knowledge is required. If no, PI decides if project should move directly to invention phase or terminate. If yes, should they pursue external funding to conduct remainder of discovery phase?

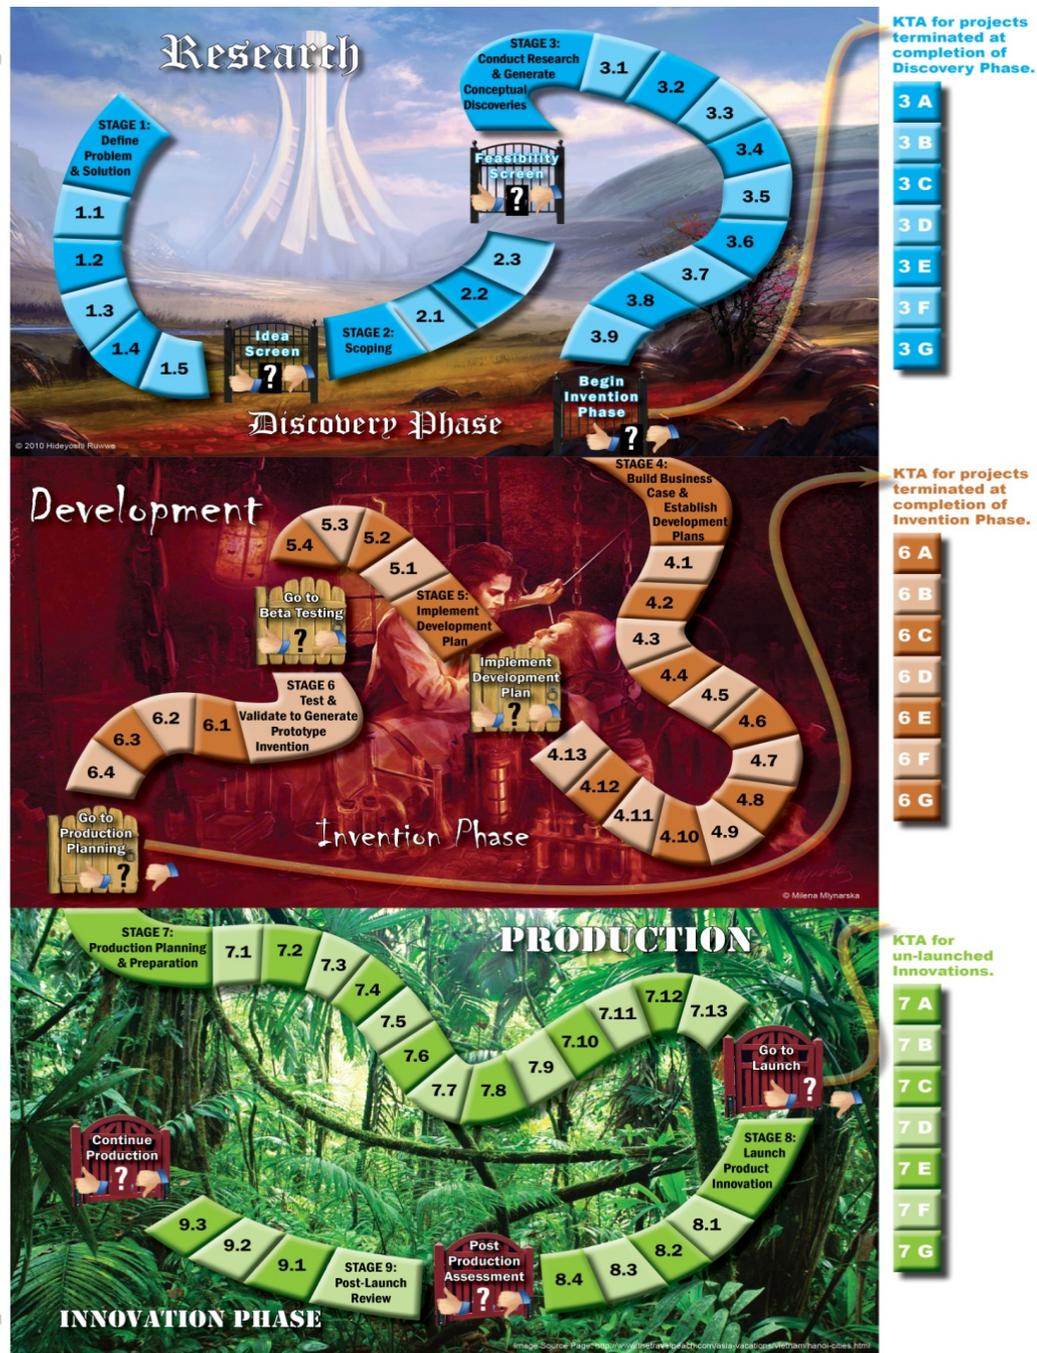

Stage 3: Conduct Research and Generate Conceptual Discoveries

- 3.1 Opportunity for KT: Identify expertise needs and assemble transdisciplinary research team (i.e. methodologist, statistician, etc.)
- Develop research problem/question.

 links to more information

Where are the Best Practices?

- *Ntk combines PDMA, KTA, and scientific research processes*
- *Supporting evidence associated with each stage, step, and tip offer best practices as defined by academic and practice literature*
- *Effective practices derived from real life case examples for each stage*

Need to Knowledge (NtK) Model for Technological Innovations

Phases	Stages and Gates

- [Secondary tips](#)

Primary findings

Barriers

Activities that may complicate team-based knowledge work include: framing the nature of the problem, scoping boundary conditions, identifying current and needed resources, establishing adequate task time frames, and clarifying roles and expected deliverables.

Case study and interviews.
[\(View full citation\)](#)

Communities may have considerable distrust of research, possibly due to negative prior experiences with research and/or authority in general.

Tools

Stage 1: Define Problem and Solution

Detailed Tool Listing

Anthropometry (Human size)

Competency group: Universal Design

Type: Design

Description: Anthropometric data sets represent a range of physical sizes of people (and their body segments) in a measured population. They show size dimensions for people according to age and gender. Size information about people is very useful in design as it gives target dimensions for a potential user base.

Citation for Description: Described by Authors

Units: Quantitative data for design applications

Advantages: After user group has been identified design specifications can be taken directly from the database.

Limitations: If the group is very specialized with very specific needs - some of this information can be misleading.

Target Audience: Marketing, Engineering, R & D

Relevant to Universal Design: Yes

Stages and Steps:

1.2
2.1, 2.2
4.2, 4.3, 4.11
5.1

Free Resource: My Anthro Itunes application (app) <http://itunes.apple.com/us/app/myanthro-basic/id303465843?mt=8>

Purchase Resource: Open Ergonomics. (n.d.). Visual Anthropometry Software. Retrieved from <http://www.openerg.com/index.htm>

Purchase Resource: Sammie CAD.(n.d.). HADRIAN (Human Anthropometric Data Requirements Investigation and ANalysis). Retrieved from <http://www.lboro.ac.uk/microsites/lids/sammie/reshad.htm>

Case Examples

- Caller Connect (Stage 2)
- Lids Off Jar Opener (Stage 4)
- Wheelchair Braking System (Stage 7)

Key Takeaways

- Due diligence saves money and time
- Reduction to practice is a necessary part of the process, but ideas are often adopted more readily than hard forms
- Manufacturing partners expect industry standard methods
- Broaden the target market when possible
